## **Basic notion and terminology**

---

## Review – What is a function?

A function can be seen a rule to convert input to output. (Just like a function in computer languages)

## What is a GF (generating function)

Given an infinite sequence  $\sigma = (a_0, a_1, \dots)$ , we associate it with a “function”  $F(x)$  written as

$$F(x) = \sum_{n \geq 0} a_n x^n,$$

called the **generating function** of  $\sigma$ .

# What is a GF (generating function)

Given an infinite sequence  $\sigma = (a_0, a_1, \dots)$ , we associate it with a “function”  $F(x)$  written as

$$F(x) = \sum_{n \geq 0} a_n x^n,$$

called the **generating function** of  $\sigma$ .

## Warning !

Very formally speaking,  $F(x)$  is **not** a function and we do **not** care if the sum converges.

We just pretend in this class that they are well-defined functions.

There are GFs that do not correspond to any function, e.g.,

$$\sum_{n \geq 0} n! x^n.$$

## Examples of GF

If  $a_0 = 1$  and  $a_n = 0$  for all  $n \geq 1$ , then

$$F(x) = \sum_{n \geq 0} a_n x^n = 1.$$

## Examples of GF

If  $a_0 = 1$  and  $a_n = 0$  for all  $n \geq 1$ , then

$$F(x) = \sum_{n \geq 0} a_n x^n = 1.$$

If  $a_n = 1$  for all  $n = 0, \dots, 4$ , and  $a_n = 0$  for all  $n \geq 5$  then

$$F(x) = 1 + x + x^2 + x^3 + x^4 = \frac{1 - x^5}{1 - x}$$

## Examples of GF

If  $a_0 = 1$  and  $a_n = 0$  for all  $n \geq 1$ , then

$$F(x) = \sum_{n \geq 0} a_n x^n = 1.$$

If  $a_n = 1$  for all  $n = 0, \dots, 4$ , and  $a_n = 0$  for all  $n \geq 5$  then

$$F(x) = 1 + x + x^2 + x^3 + x^4 = \frac{1 - x^5}{1 - x}$$

If  $a_n = 1$  for all  $n = 0, \dots, m$ , and  $a_n = 0$  for all  $n \geq m + 1$  then

$$F(x) = 1 + x + x^2 + \dots + x^m = \frac{1 - x^{m+1}}{1 - x}$$

## Examples of GF

If  $a_n = 1$  for all  $n \geq 0$ , then

$$F(x) = \sum_{n \geq 0} x^n = \frac{1}{1-x}.$$

## Examples of GF

If  $a_n = 1$  for all  $n \geq 0$ , then

$$F(x) = \sum_{n \geq 0} x^n = \frac{1}{1-x}.$$

If  $a_n = 1/n!$  for all  $n \geq 0$ , then

$$F(x) = \sum_{n \geq 0} \frac{1}{n!} x^n = e^x.$$

## Examples of GF

If  $a_n = 1$  for all  $n \geq 0$ , then

$$F(x) = \sum_{n \geq 0} x^n = \frac{1}{1-x}.$$

If  $a_n = 1/n!$  for all  $n \geq 0$ , then

$$F(x) = \sum_{n \geq 0} \frac{1}{n!} x^n = e^x.$$

If  $a_0 = 0$  and  $a_n = 1/n$  for all  $n \geq 1$ , then

$$\sum_{n \geq 1} \frac{1}{n} x^n = -\log\left(\frac{1}{1-x}\right)$$

## Quiz

$$\sum_{n \geq 0} \binom{m}{n} x^n = ?$$

# Examples of GF

## Quiz

$$\sum_{n \geq 0} \binom{m}{n} x^n = ?$$

## Quiz

$$\sum_{n \geq 0} \frac{1}{(2n)!} x^{2n} = ?$$

# Generating functions and combinatorics

---

# Combinatorial Sum

Let  $\mathcal{A}$  and  $\mathcal{B}$  be two sets contains objects which has sizes, e.g.,

$$\mathcal{A} = \{ \text{\$}, \text{\$ \$}, \text{\$ \$ \$}, \dots \},$$

$$\mathcal{B} = \{ \text{🍏}, \text{🍏}, \text{🍏🍏}, \text{🍏🍏}, \text{🍏🍏🍏}, \text{🍏🍏🍏}, \dots \}.$$

$$\mathcal{C} = \mathcal{A} \cup \mathcal{B} = \{ \text{🍏}, \text{🍏}, \text{\$}, \text{🍏🍏}, \text{🍏🍏}, \text{\$ \$}, \text{🍏🍏🍏}, \text{🍏🍏🍏}, \text{\$ \$ \$}, \dots \}.$$

# Combinatorial Sum

Let  $\mathcal{A}$  and  $\mathcal{B}$  be two sets contains objects which has sizes, e.g.,

$$\mathcal{A} = \{ \text{\$}, \text{\$ \$}, \text{\$ \$ \$}, \dots \},$$

$$\mathcal{B} = \{ \text{🍏}, \text{🍏}, \text{🍏🍏}, \text{🍏🍏}, \text{🍏🍏🍏}, \text{🍏🍏🍏}, \dots \}.$$

$$\mathcal{C} = \mathcal{A} \cup \mathcal{B} = \{ \text{🍏}, \text{🍏}, \text{\$}, \text{🍏🍏}, \text{🍏🍏}, \text{\$ \$}, \text{🍏🍏🍏}, \text{🍏🍏🍏}, \text{\$ \$ \$}, \dots \}.$$

Let  $a_n$  ( $b_n$ ) be the number of objects of size  $n$  in  $\mathcal{A}$  ( $\mathcal{B}$ ).

Let  $A(x)$  and  $B(x)$  be the GFs for  $a_n$  and  $b_n$ .

# Combinatorial Sum

Let  $\mathcal{A}$  and  $\mathcal{B}$  be two sets contains objects which has sizes, e.g.,

$$\mathcal{A} = \{ \text{\$}, \text{\$ \$}, \text{\$ \$ \$}, \dots \},$$

$$\mathcal{B} = \{ \text{🍏}, \text{🍏}, \text{🍏 🍏}, \text{🍏 🍏}, \text{🍏 🍏 🍏}, \text{🍏 🍏 🍏}, \dots \}.$$

$$\mathcal{C} = \mathcal{A} \cup \mathcal{B} = \{ \text{🍏}, \text{🍏}, \text{\$}, \text{🍏 🍏}, \text{🍏 🍏}, \text{\$ \$}, \text{🍏 🍏 🍏}, \text{🍏 🍏 🍏}, \text{\$ \$ \$}, \dots \}.$$

Let  $a_n$  ( $b_n$ ) be the number of objects of size  $n$  in  $\mathcal{A}$  ( $\mathcal{B}$ ).

Let  $A(x)$  and  $B(x)$  be the GFs for  $a_n$  and  $b_n$ .

**Punch line!** – Then the GF for  $\mathcal{C} = \mathcal{A} \cup \mathcal{B}$  is

$$C(x) = A(x) + B(x) = \sum_{n \geq 0} a_n x^n + \sum_{n \geq 0} b_n x^n = \sum_{n \geq 0} (a_n + b_n) x^n$$

## Combinatorial Sum – Example

$$\mathcal{A} = \{ \text{\$}, \text{\$ \$}, \text{\$ \$ \$}, \dots \},$$

$$\mathcal{B} = \{ \text{apple}, \text{pear}, \text{apple apple}, \text{pear pear}, \text{apple apple apple}, \text{pear pear pear}, \dots \}.$$

$$\mathcal{C} = \mathcal{A} \cup \mathcal{B} = \{ \text{apple}, \text{pear}, \text{\$}, \text{apple apple}, \text{pear pear}, \text{\$ \$}, \text{apple apple apple}, \text{pear pear pear}, \text{\$ \$ \$}, \dots \}.$$

In the example above,  $a_n = 1$  and  $b_n = 2$  for all  $n$ . So

$$A(x) = \sum_{n \geq 1} x^n = \frac{x}{1-x},$$

$$B(x) = \sum_{n \geq 1} 2x^n = 2 \frac{x}{1-x},$$

$$C(x) = A(x) + B(x) = 3 \frac{x}{1-x} = \sum_{n \geq 1} 3x^n.$$

# Combinatorial Product

Let  $\mathcal{A}$  and  $\mathcal{B}$  be two sets contains objects which has sizes, e.g.,

$$\mathcal{A} = \{\emptyset, \text{\$}, \text{\$ \$}, \text{\$ \$ \$}, \dots\}, \quad \mathcal{B} = \{\emptyset, \text{\text{apple}}, \text{\text{apple apple}}, \text{\text{apple apple apple}}, \dots\}.$$

$$\mathcal{C} = \mathcal{A} \times \mathcal{B} = \{(\emptyset, \emptyset), (\emptyset, \text{\text{apple}}), (\text{\$}, \emptyset), (\emptyset, \text{\text{apple apple}}), (\text{\$ \$}, \emptyset), (\text{\$}, \text{\text{apple}}), \dots\}.$$

## Combinatorial Product

Let  $\mathcal{A}$  and  $\mathcal{B}$  be two sets contains objects which has sizes, e.g.,

$$\mathcal{A} = \{\emptyset, \text{\$}, \text{\$ \$}, \text{\$ \$ \$}, \dots\}, \quad \mathcal{B} = \{\emptyset, \text{\text{apple}}, \text{\text{apple apple}}, \text{\text{apple apple apple}}, \dots\}.$$

$$\mathcal{C} = \mathcal{A} \times \mathcal{B} = \{(\emptyset, \emptyset), (\emptyset, \text{\text{apple}}), (\text{\$}, \emptyset), (\emptyset, \text{\text{apple apple}}), (\text{\$ \$}, \emptyset), (\text{\$}, \text{\text{apple}}), \dots\}.$$

Let  $a_n$  ( $b_n$ ) be the number of objects of size  $n$  in  $\mathcal{A}$  ( $\mathcal{B}$ ).

Let  $A(x)$  and  $B(x)$  be the GFs for  $a_n$  and  $b_n$ .

# Combinatorial Product

Let  $\mathcal{A}$  and  $\mathcal{B}$  be two sets contains objects which has sizes, e.g.,

$$\mathcal{A} = \{\emptyset, \text{\$}, \text{\$ \$}, \text{\$ \$ \$}, \dots\}, \quad \mathcal{B} = \{\emptyset, \text{\text{apple}}, \text{\text{apple apple}}, \text{\text{apple apple apple}}, \dots\}.$$

$$\mathcal{C} = \mathcal{A} \times \mathcal{B} = \{(\emptyset, \emptyset), (\emptyset, \text{\text{apple}}), (\text{\$}, \emptyset), (\emptyset, \text{\text{apple apple}}), (\text{\$ \$}, \emptyset), (\text{\$}, \text{\text{apple}}), \dots\}.$$

Let  $a_n$  ( $b_n$ ) be the number of objects of size  $n$  in  $\mathcal{A}$  ( $\mathcal{B}$ ).

Let  $A(x)$  and  $B(x)$  be the GFs for  $a_n$  and  $b_n$ .

**Punch line!** – Then the GF for  $\mathcal{C} = \mathcal{A} \times \mathcal{B}$  is

$$\begin{aligned} C(x) &= A(x)B(x) = \left( \sum_{n \geq 0} a_n x^n \right) \left( \sum_{n \geq 0} b_n x^n \right) \\ &= \sum_{n \geq 0} \left( \sum_{k=0}^n a_k b_{n-k} \right) x^n \end{aligned}$$

# Newton's Binomial Theorem

---

## Extend the definition of $\binom{r}{k}$

For integers  $n \geq m \geq 0$ , we have defined that

$$\binom{n}{m} = \frac{P(n, m)}{m!} = \frac{n(n-1)(n-2) \dots (n-m+1)}{m!}$$

## Extend the definition of $\binom{r}{k}$

For integers  $n \geq m \geq 0$ , we have defined that

$$\binom{n}{m} = \frac{P(n, m)}{m!} = \frac{n(n-1)(n-2)\dots(n-m+1)}{m!}$$

But let's be crazier and let  $r \in \mathbb{R}$  and  $k \in \mathbb{Z}$  and define

$$\binom{r}{k} = \begin{cases} \frac{r(r-1)(r-2)\dots(r-k+1)}{k!} & k > 0, \\ 1 & k = 0, \\ 0 & k < 0. \end{cases}$$

## Extend the definition of $\binom{r}{k}$

$$\binom{r}{k} = \begin{cases} \frac{r(r-1)(r-2)\dots(r-k+1)}{k!} & k > 0, \\ 1 & k = 0, \\ 0 & k < 0. \end{cases}$$

## Extend the definition of $\binom{r}{k}$

$$\binom{r}{k} = \begin{cases} \frac{r(r-1)(r-2)\dots(r-k+1)}{k!} & k > 0, \\ 1 & k = 0, \\ 0 & k < 0. \end{cases}$$

For integers  $k > r \geq 0$ ,  $\binom{r}{k} = 0$  – there is no way to choose 5 🍌 out of 3 🍌.

For integers  $r \geq 0$  and  $k < 0$ ,  $\binom{r}{k} = 0$  – there is no way to choose -1 🍌 out of 3 🍌.

If  $k = 0$ ,  $\binom{r}{0} = 1$  – there is one way to choose 0 🍌 (do nothing)

## Extend the definition of $\binom{r}{k}$

$$\binom{r}{k} = \begin{cases} \frac{r(r-1)(r-2)\dots(r-k+1)}{k!} & k > 0, \\ 1 & k = 0, \\ 0 & k < 0. \end{cases}$$

For integers  $k > r \geq 0$ ,  $\binom{r}{k} = 0$  – there is no way to choose 5 🍌 out of 3 🍌.

For integers  $r \geq 0$  and  $k < 0$ ,  $\binom{r}{k} = 0$  – there is no way to choose -1 🍌 out of 3 🍌.

If  $k = 0$ ,  $\binom{r}{0} = 1$  – there is one way to choose 0 🍌 (do nothing)

### Example

$$\binom{-7/2}{5} = \frac{(-7/2)(-9/2)(-11/2)(-13/2)(-15/2)}{5!}.$$

## Quiz

How is  $2^\pi$  defined?

## Quiz

How is  $2^\pi$  defined?

## Theorem 8.10

For all  $p \in \mathbb{R}$  with  $p \neq 0$ ,

$$(1 + x)^p = \sum_{n \geq 0} \binom{p}{n} x^n$$

# Newton's Binomial Theorem

## Quiz

How is  $2^\pi$  defined?

## Theorem 8.10

For all  $p \in \mathbb{R}$  with  $p \neq 0$ ,

$$(1+x)^p = \sum_{n \geq 0} \binom{p}{n} x^n$$

When  $p \in \mathbb{N}$ , this is just binomial theorem.

Proof by taking the Taylor expansion of  $(1+x)^p$  at  $x=0$ .

## Combinatorial Product – revisited

The sets

$$\mathcal{A} = \{\emptyset, \text{\$}, \text{\$ \$}, \text{\$ \$ \$}, \dots\}, \quad \mathcal{B} = \{\emptyset, \text{\text{apple}}, \text{\text{apple apple}}, \text{\text{apple apple apple}}, \dots\}.$$

$$\mathcal{C} = \mathcal{A} \times \mathcal{B} = \{(\emptyset, \emptyset), (\emptyset, \text{\text{apple}}), (\text{\$}, \emptyset), (\emptyset, \text{\text{apple apple}}), (\text{\$ \$}, \emptyset), (\text{\$}, \text{\text{apple}}), \dots\}.$$

## Combinatorial Product – revisited

The sets

$$\mathcal{A} = \{\emptyset, \text{\$}, \text{\$ \$}, \text{\$ \$ \$}, \dots\}, \quad \mathcal{B} = \{\emptyset, \text{\text{apple}}, \text{\text{apple apple}}, \text{\text{apple apple apple}}, \dots\}.$$

$$\mathcal{C} = \mathcal{A} \times \mathcal{B} = \{(\emptyset, \emptyset), (\emptyset, \text{\text{apple}}), (\text{\$}, \emptyset), (\emptyset, \text{\text{apple apple}}), (\text{\$ \$}, \emptyset), (\text{\$}, \text{\text{apple}}), \dots\}.$$

The GF

$$A(x) = \frac{1}{1-x}, \quad B(x) = \frac{1}{1-x}, \quad C(x) = \left(\frac{1}{1-x}\right)^2$$

## Combinatorial Product – revisited

The sets

$$\mathcal{A} = \{\emptyset, \text{\$}, \text{\$ \$}, \text{\$ \$ \$}, \dots\}, \quad \mathcal{B} = \{\emptyset, \text{\text{apple}}, \text{\text{apple apple}}, \text{\text{apple apple apple}}, \dots\}.$$

$$\mathcal{C} = \mathcal{A} \times \mathcal{B} = \{(\emptyset, \emptyset), (\emptyset, \text{\text{apple}}), (\text{\$}, \emptyset), (\emptyset, \text{\text{apple apple}}), (\text{\$ \$}, \emptyset), (\text{\$}, \text{\text{apple}}), \dots\}.$$

The GF

$$A(x) = \frac{1}{1-x}, \quad B(x) = \frac{1}{1-x}, \quad C(x) = \left(\frac{1}{1-x}\right)^2$$

By Newton's binomial theorem

$$C(x) = \sum_{n \geq 0} \binom{-2}{n} (-x)^n$$

and

$$[x^n]C(x) = (-1)^n \frac{(-2)(-3) \dots (-2-n+1)}{n!} = \frac{(n+1)!}{n!} = n+1$$

# Applying Newton's Binomial Theorem

## Lemma 8.12

For all integers  $m \geq 0$ ,

$$\binom{-1/2}{m} = (-1)^m \frac{\binom{2m}{m}}{2^{2m}}.$$

Proof by induction. **Quiz** What is  $\binom{-1/2}{0}$ ?

# Applying Newton's Binomial Theorem

## Lemma 8.12

For all integers  $m \geq 0$ ,

$$\binom{-1/2}{m} = (-1)^m \frac{\binom{2m}{m}}{2^{2m}}.$$

Proof by induction. **Quiz** What is  $\binom{-1/2}{0}$ ?

$$\begin{aligned}\binom{-1/2}{m+1} &= \frac{P(-1/2, m+1)}{(m+1)!} = \frac{P(-1/2, m)(-1/2 - m)}{(m+1)m!} \\ &= \frac{-1/2 - m}{m+1} \binom{-1/2}{m} = (-1) \frac{2m+1}{2(m+1)} (-1)^m \frac{\binom{2m}{m}}{2^{2m}} \\ &= (-1)^{m+1} \frac{1}{2^{2m}} \frac{(2m+2)(2m+1)}{(2m+2)2(m+1)} \binom{2m}{m} = (-1)^{m+1} \frac{\binom{2m+2}{m+2}}{2^{2m+2}}.\end{aligned}$$

# Applying Newton's Binomial Theorem

## Theorem 8.13

$$\frac{1}{\sqrt{1-4x}} = \sum_{n \geq 0} \binom{2n}{n} x^n.$$

$$\begin{aligned}(1-4x)^{-1/2} &= \sum_{n=0}^{\infty} \binom{-1/2}{n} (-4x)^n \\ &= \sum_{n=0}^{\infty} (-1)^n 2^{2n} \binom{-1/2}{n} x^n \\ &= \sum_{n=0}^{\infty} \binom{2n}{n} x^n.\end{aligned}$$

Does this ring a bell?

## Quiz - Corollary 8.14

Use

$$\frac{1}{\sqrt{1-4x}} = \sum_{n \geq 0} \binom{2n}{n} x^n$$

to show that for all integers  $n \geq 0$

$$2^{2n} = \sum_{k \geq 0} \binom{2k}{k} \binom{2n-2k}{n-k}.$$

## **Another look at Amanda's money**

---

## Give 1 to $k$ child

The ways to give  to 1 child forms the set

$$\mathcal{A} = \{ \text{,  ,   , \dots \}$$

## Give 1 to $k$ child

The ways to give  to 1 child forms the set

$$\mathcal{A} = \{ \text{\$}, \text{\$ \$}, \text{\$ \$ \$}, \dots \}$$

Since there are  $a_n = 1$  way to distribute  $n$   among 1 child so the child has  $> 0$  , the GF of  $\mathcal{A}$  is

$$A(x) = x + x^2 + x^3 + \dots = \frac{x}{1-x}$$

Note  $a_0 = 0$ .

## Give 1 \$ to $k$ child

The ways to give \$ to 1 child forms the set

$$\mathcal{A} = \{ \$, \$ \$, \$ \$ \$, \dots \}$$

Since there are  $a_n = 1$  way to distribute  $n$  \$ among 1 child so the child has  $> 0$  \$, the GF of  $\mathcal{A}$  is

$$A(x) = x + x^2 + x^3 + \dots = \frac{x}{1-x}$$

Note  $a_0 = 0$ .

So  $\mathcal{A}^k$  contains the ways to distribute  $n$  \$ among  $k$  children. Its GF is

$$A(x)^k = \left( \frac{x}{1-x} \right)^k$$

### Quiz

What is the combinatorial meaning of the coefficient of  $x^6$  in

$$(x + x^2 \dots)(x + x^2 \dots)(x + x^2 \dots)(x + x^2 \dots)(x + x^2 \dots) = \frac{x^5}{(1-x)^5}$$

## Give $n$ to 5 child

### Quiz

What is the combinatorial meaning of the coefficient of  $x^6$  in

$$(x + x^2 \dots)(x + x^2 \dots)(x + x^2 \dots)(x + x^2 \dots)(x + x^2 \dots) = \frac{x^5}{(1-x)^5}$$

It is the number of ways to distribute 6  among 5 children so everyone has  $> 0$  

I.e.,  $\binom{5}{4} = 5$  by the balls and bars argument.

## Give $n$ s to 5 child

Use SageMath, it is also easy to see that it is 5, and in general, the coefficient of  $x^{n+1}$  is  $\binom{n}{4}$ .

## Give $n$ to 5 child

Use SageMath, it is also easy to see that it is 5, and in general, the coefficient of  $x^{n+1}$  is  $\binom{n}{4}$ .

To get this without computer or combinatorics

$$\begin{aligned}\frac{x^5}{(1-x)^5} &= \frac{x^5}{4!} \frac{d^4}{dx^4} \left( \frac{1}{1-x} \right) = \frac{x^5}{4!} \sum_{n=0}^{\infty} n(n-1)(n-2)(n-3)x^{n-4} \\ &= \sum_{n=0}^{\infty} \frac{n(n-1)(n-2)(n-3)}{4!} x^{n+1} = \sum_{n=0}^{\infty} \binom{n}{4} x^{n+1}.\end{aligned}$$

## Give 5 \$ to 3 children allowing empty hands

How many ways can we distribute 5 \$ to 3 children, allowing a child to have 0 \$?

The trick is to use bars and balls with three extra \$, e.g.,

This example gives the children 3, 4, 1 \$.

## Give 5 \$ to 3 children allowing empty hands

How many ways can we distribute 5 \$ to 3 children, allowing a child to have 0 \$?

The trick is to use bars and balls with three extra \$, e.g.,

This example gives the children 3, 4, 1 \$.

But then we just take back one \$ from each child, so they get 2, 3, 0 \$.

So the answer is  $\binom{8}{2}$ .

## Give $n$ \$ to $k$ children allowing empty hands

How many ways can we distribute  $n$  \$ to  $k$  children, allowing a child to have 0 \$?

The trick is to add  $k$  extra \$.

Then we distribute it by inserting  $k - 1$  bars among the  $n + k - 1$  gaps.

In the end, we take back one \$ from each child.

So there this is in total  $\binom{n+k-1}{k-1}$  ways to do so.

## Give $n$ to $k$ children allowing empty hands

$(1 - x)^{-n}$  is GF for  $\mathcal{A}^n$  with

$$\mathcal{A} = \{ \emptyset, \text{\$}, \text{\$ \$}, \text{\$ \$ \$}, \dots \},$$

$[x^k](1 - x)^{-n}$  is the number of ways to distribute  $n$  one-dollar bills to  $k$  children, **allowing children to have no money**.

## Give $n$ to $k$ children allowing empty hands

$(1 - x)^{-n}$  is GF for  $\mathcal{A}^n$  with

$$\mathcal{A} = \{ \emptyset, \text{\$}, \text{\$ \$}, \text{\$ \$ \$}, \dots \},$$

$[x^k](1 - x)^{-n}$  is the number of ways to distribute  $n$  one-dollar bills to  $k$  children, **allowing children to have no money**. By the bars and balls argument, this is  $\binom{n+k-1}{k-1}$  for  $k \geq 1$ . So

$$\frac{1}{(1 - x)^n} = 1 + \sum_{k \geq 1} \binom{n + k - 1}{k - 1} x^k.$$

## Give $n$ to $k$ children allowing empty hands

$(1 - x)^{-n}$  is GF for  $\mathcal{A}^n$  with

$$\mathcal{A} = \{ \emptyset, \text{\$}, \text{\$ \$}, \text{\$ \$ \$}, \dots \},$$

$[x^k](1 - x)^{-n}$  is the number of ways to distribute  $n$  one-dollar bills to  $k$  children, **allowing children to have no money**. By the bars and balls argument, this is  $\binom{n+k-1}{k-1}$  for  $k \geq 1$ . So

$$\frac{1}{(1 - x)^n} = 1 + \sum_{k \geq 1} \binom{n + k - 1}{k - 1} x^k.$$

Or by Newton's binomial theorem

$$\frac{1}{(1 - x)^n} = \sum_{k \geq 0} \binom{-n}{k} (-1)^k x^k$$

## Example 8.5

A grocery store is preparing holiday fruit baskets for sale. Each fruit basket will have 20 pieces of fruit in it, chosen from , , , and . How many different ways can such a basket be prepared if there must be at least one apple in a basket, a basket cannot contain more than three pears, and the number of  must be a multiple of four?

## Fruit basket – Equivalent problem

Let

$$\mathcal{A} = \{ \text{🍏}, \text{🍏🍏}, \text{🍏🍏🍏}, \dots \}, \quad \mathcal{P} = \{ \emptyset, \text{🍐}, \text{🍐🍐}, \text{🍐🍐🍐}, \dots \},$$

$$\mathcal{O} = \{ \emptyset, \text{🍊🍊🍊🍊}, \text{🍊🍊🍊🍊🍊🍊🍊🍊}, \dots \},$$

$$\mathcal{G} = \{ \emptyset, \text{🍇}, \text{🍇🍇🍇}, \text{🍇🍇🍇🍇}, \dots \},$$

What is the number of objects in  $\mathcal{B} = \mathcal{A} \times \mathcal{P} \times \mathcal{O} \times \mathcal{G}$  of size 20?

## Fruit basket – Equivalent problem

Let

$$\mathcal{A} = \{ \text{🍏}, \text{🍏🍏}, \text{🍏🍏🍏}, \dots \}, \quad \mathcal{P} = \{ \emptyset, \text{🍏}, \text{🍏🍏}, \text{🍏🍏🍏}, \dots \},$$

$$\mathcal{O} = \{ \emptyset, \text{🍊🍊🍊}, \text{🍊🍊🍊🍊🍊🍊}, \dots \},$$

$$\mathcal{G} = \{ \emptyset, \text{🍇}, \text{🍇🍇🍇}, \text{🍇🍇🍇🍇}, \dots \},$$

What is the number of objects in  $\mathcal{B} = \mathcal{A} \times \mathcal{P} \times \mathcal{O} \times \mathcal{G}$  of size 20?

### Quiz

What is the GF for pears?

The GFs are

$$A(x) = x + x^2 + x^3 \dots = \frac{x}{1-x}, \quad P(x) = 1 + x + x^2 + x^3,$$

$$O(x) = 1 + x^4 + x^8 \dots = \frac{1}{1-x^4},$$

$$G(x) = 1 + x + x^2 + x^3 \dots = \frac{1}{1-x}.$$

The GFs are

$$A(x) = x + x^2 + x^3 \dots = \frac{x}{1-x}, \quad P(x) = 1 + x + x^2 + x^3,$$

$$O(x) = 1 + x^4 + x^8 \dots = \frac{1}{1-x^4},$$

$$G(x) = 1 + x + x^2 + x^3 \dots = \frac{1}{1-x}.$$

The GF of  $\mathcal{B}$  (baskets) is

$$B(x) = A(x)P(x)O(x)G(x)$$

So the answer is

$$[x^{20}]B(x) = 210,$$

and  $[x^n]B(x) = n(n+1)/2$  – pretty easy by SageMath.

## Fruit basket

So the answer is

$$[x^{20}]B(x) = 210,$$

and  $[x^n]B(x) = n(n+1)/2$  – pretty easy by SageMath. Without computer  $B(x)$  is

$$\frac{x}{1-x}(1+x+x^2+x^3)\frac{1}{1-x^4}\frac{1}{1-x} = \frac{x}{(1-x)^2(1-x^4)}(1+x+x^2+x^3).$$

$$\frac{x}{(1-x)^3} = \frac{x}{2} \sum_{n=0}^{\infty} n(n-1)x^{n-2} = \sum_{n=0}^{\infty} \frac{n(n-1)}{2} x^{n-1}$$

## Integer composition – with restriction

**Example 8.6.** Find the number of integer solutions to the equation

$$x_1 + x_2 + x_3 = n$$

( $n \geq 0$  an integer) with  $x_1 \geq 0$  even,  $x_2 \geq 0$ , and  $0 \leq x_3 \leq 2$ .

The GFs for  $x_1, x_2, x_3$  are

$$1 + x^2 + x^4 + \dots = \frac{1}{1 - x^2}, \quad 1 + x + x^2 \dots = \frac{1}{1 - x}, \quad 1 + x + x^2$$

The GF for the solution is

$$\frac{1 + x + x^2}{(1 - x)(1 - x^2)} = \frac{1 + x + x^2}{(1 + x)(1 - x)^2}$$

## Partial fraction

We can further simplify to the form

$$\frac{1+x+x^2}{(1+x)(1-x)^2} = \frac{A}{1+x} + \frac{B}{1-x} + \frac{C}{(1-x)^2}$$

form some constant  $A, B, C$ .

## Partial fraction

We can further simplify to the form

$$\frac{1+x+x^2}{(1+x)(1-x)^2} = \frac{A}{1+x} + \frac{B}{1-x} + \frac{C}{(1-x)^2}$$

form some constant  $A, B, C$ . This implies

$$1+x+x^2 = A(1-x)^2 + B(1-x^2) + C(1+x)$$

## Partial fraction

We can further simplify to the form

$$\frac{1+x+x^2}{(1+x)(1-x)^2} = \frac{A}{1+x} + \frac{B}{1-x} + \frac{C}{(1-x)^2}$$

form some constant  $A, B, C$ . This implies

$$1+x+x^2 = A(1-x)^2 + B(1-x)^2 + C(1+x)$$

Equating coefficients on terms of equal degree

$$1 = A + B + C, \quad 1 = -2A + C, \quad 1 = A - B.$$

Solving this gives

$$A = \frac{1}{4}, \quad B = \frac{-3}{4}, \quad C = \frac{3}{2}$$

## Integer composition – with restriction

This simplifies to

$$\begin{aligned} & \frac{1}{4} \frac{1}{1+x} - \frac{3}{4} \frac{1}{1-x} + \frac{3}{2} \frac{1}{(1-x)^2} \\ &= \frac{1}{4} \sum_{n=0}^{\infty} (-1)^n x^n - \frac{3}{4} \sum_{n=0}^{\infty} x^n + \frac{3}{2} \sum_{n=0}^{\infty} n x^{n-1}. \end{aligned}$$

So the coefficient of  $x^n$  is

$$\frac{(-1)^n}{4} - \frac{3}{4} + \frac{3(n+1)}{2}.$$

## Integer composition – without restriction

This is the GF of distributing  $n$  \$ to any number of (distinguishable) children, so no one has 0 \$.

$$1 + \frac{x}{1-x} + \left(\frac{x}{1-x}\right)^2 + \left(\frac{x}{1-x}\right)^3 + \dots = \frac{1}{1 - \frac{x}{1-x}} = \frac{1-x}{1-2x}.$$

## Integer composition – without restriction

This is the GF of distributing  $n$  \$ to any number of (distinguishable) children, so no one has 0 \$.

$$1 + \frac{x}{1-x} + \left(\frac{x}{1-x}\right)^2 + \left(\frac{x}{1-x}\right)^3 + \dots = \frac{1}{1 - \frac{x}{1-x}} = \frac{1-x}{1-2x}.$$

Since

$$\frac{1-x}{1-2x} = \left( \sum_{n \geq 0} 2^n x^n \right) - \left( \sum_{n \geq 0} 2^n x^{n+1} \right),$$

the coefficient of  $x^n$  is  $2^{n-1}$  for  $n \geq 1$ .

## Integer composition – without restriction

This is the GF of distributing  $n$   to any number of (distinguishable) children, so no one has 0 .

$$1 + \frac{x}{1-x} + \left(\frac{x}{1-x}\right)^2 + \left(\frac{x}{1-x}\right)^3 + \dots = \frac{1}{1 - \frac{x}{1-x}} = \frac{1-x}{1-2x}.$$

Since

$$\frac{1-x}{1-2x} = \left( \sum_{n \geq 0} 2^n x^n \right) - \left( \sum_{n \geq 0} 2^n x^{n+1} \right),$$

the coefficient of  $x^n$  is  $2^{n-1}$  for  $n \geq 1$ .

By the balls and bars argument, this is  $2^{n-1}$  for  $n \geq 1$ . Why?
